# Aufgabe 1 - Ant-File

- ANT zum OS-Suchpfad (PATH) hinzufügen
- Kommandozeilenparameter verstehen
- Ordner mit den jar-Dateien erstellen (z.B. ./ant\_lib/)

```
C:\Windows\system32\cmd.exe
C:\workspace\assignment1>ant -help
ant [options] [target [target2 [target3] ...]]
options:
  -help, -h                print this message
  -projecthelp, -p        print project help information
  -version                print the version information and exit
  -diagnostics            print information that might be helpful to
                          diagnose or report problems.
  -quiet, -q              be extra quiet
  -verbose, -v            be extra verbose
  -debug, -d              print debugging information
  -emacs, -e              produce logging information without adornments
  -lib <path>              specifies a path to search for jars and classes
  -logfile <file>         use given file for log
                          -l <file>
  -logger <classname>    the class which is to perform logging
  -listener <classname>  add an instance of class as a project listener
  -noinput                do not allow interactive input
  -buildfile <file>      use given buildfile
                          -file <file>
                          -f <file>
  -D<property>=<value>   use value for given property
  -keep-going, -k        execute all targets that do not depend
                          on failed target(s)
  -propertyfile <name>   load all properties from file with -D
                          properties taking precedence
  -inputhandler <class>  the class which will handle input requests
  -find <file>           (s)earch for buildfile towards the root of
                          the filesystem and use it
  -s <file>
  -nice number            A niceness value for the main thread:
                          1 (lowest) to 10 (highest); 5 is the default
  -nouserlib              Run ant without using the jar files from
                          ${user.home}/.ant/lib
  -noclasspath            Run ant without using CLASSPATH
  -autoproxy              Java1.5+: use the OS proxy settings
  -main <class>          override Ant's normal entry point
```

22         </batchtest>
23     </junit>
24 </target>
```

## Aufgabe 2 - Dreieckszahl

---

- Quasi trivial lösbar durch
  - Iteration  $\Delta(n) = \sum_{i=1}^n i$  oder
  - Gaußsche Summenformel  $\Delta(n) = \frac{n \cdot (n + 1)}{2}$
- Ausnahme:  $n \geq 2^{16}$ 
  - **int** overflow ( $2^{31} \leq i \leq 2^{31}-1$ )
- Lösung: Rechnen mit **long**
- hexadezimal: Long.toHexString(n)

## Aufgabe 3 - Fakultät

- Lösung durch Iteration  $n! = \prod_{i=1}^n i$ ,
- Problem
  - **int** overflow bei  $n \geq 13$
  - **long** overflow bei  $n \geq 21$
- Lösung
  - Rechnen mit **BigInteger**:

```
1 BigInteger prod = BigInteger.ONE;  
2 prod = prod.multiply(BigInteger.valueOf(2));  
3 // ...  
4 return prod.toString(16);
```

## Aufgabe 4 - Fibonacci (naiv-rekursiv)

- Lösung: straightforward
- Problem:
  - naive rekursive Definition führt zu einer exponentiellen Anzahl von Funktionsaufrufen:

$$\begin{aligned}
 fib(n) &= fib(n-1) + fib(n-2) \\
 &= \overbrace{fib(n-2)+fib(n-3)} + \overbrace{fib(n-3)+fib(n-4)} \\
 &= \overbrace{fib(n-3)+fib(n-4)} + \overbrace{fib(n-4)+fib(n-5)} + \\
 &\quad \overbrace{fib(n-4)+fib(n-5)} + \overbrace{fib(n-5)+fib(n-6)} \\
 &= \dots
 \end{aligned}$$

## Aufgabe 2 – Fibonacci (iterativ)

- Idee: Anwendung der Endrekursion
  - Beginne einmalig am Ende der Rekursion  
*fib(2)* (letzter Wert) und *fib(1)* (vorletzter Wert)
  - Summiere  $n-2$  mal den letzten / vorletzten Wert

```
1 //...
2 long last = 1, nextToLast = 1;
3 for(long l=2;l<n;l++) {
4     final long curr = last + nextToLast;
5     nextToLast = last;
6     last = curr;
7 }
8 return last;
9 }
```

# Aufgabe 5 - Leiteraufstieg

- Idee
  - Anzahl der Möglichkeiten für  $n$  Sprossen ist identisch zur Summe der Möglichkeiten für  $n-1$  und  $n-2$  Sprossen
  - Bsp. :
$$\text{comb}(n=4) = \text{comb}(n=3) + \text{comb}(n=2)$$
$$\text{comb}(n=4) = \overbrace{\text{comb}(n=2) + \text{comb}(n=1)} + \text{comb}(n=2)$$
$$\text{comb}(n=4) = 2 + 1 + 2 = 5$$
- Ähnlichkeit zu Fibonacci
- Zur Terminierung des Algorithmus für  $n=90$   
→ Iterative Berechnung

# Zusatzaufgabe - Halloween

---

# Zusatzaufgabe – Halloween: Problem

- Simulation ist teuer!
- Wertebereiche:
  - $1 \leq N < 200$
  - $0 \leq s[i] \leq 50\,000$   
( $\forall i: 0 \leq i \leq N$ )

# Zusatzaufgabe – Halloween: Lösung

```
public static int minOperationCount(int[] s) {  
    int min = 50001;  
    int sum = 0;  
  
    for (int i = 0; i < s.length; i++) {  
        min = Math.min(min, s[i]);  
        sum += s[i];  
    }  
    return sum - s.length * min;  
}
```
