Software Engineering II
WS 2016/17

Prof. Plattner, Dr. Uflacker
Enterprise Platform and Integration Concepts

HPI Hasso Plattner Institut
IT Systems Engineering | Universität Potsdam

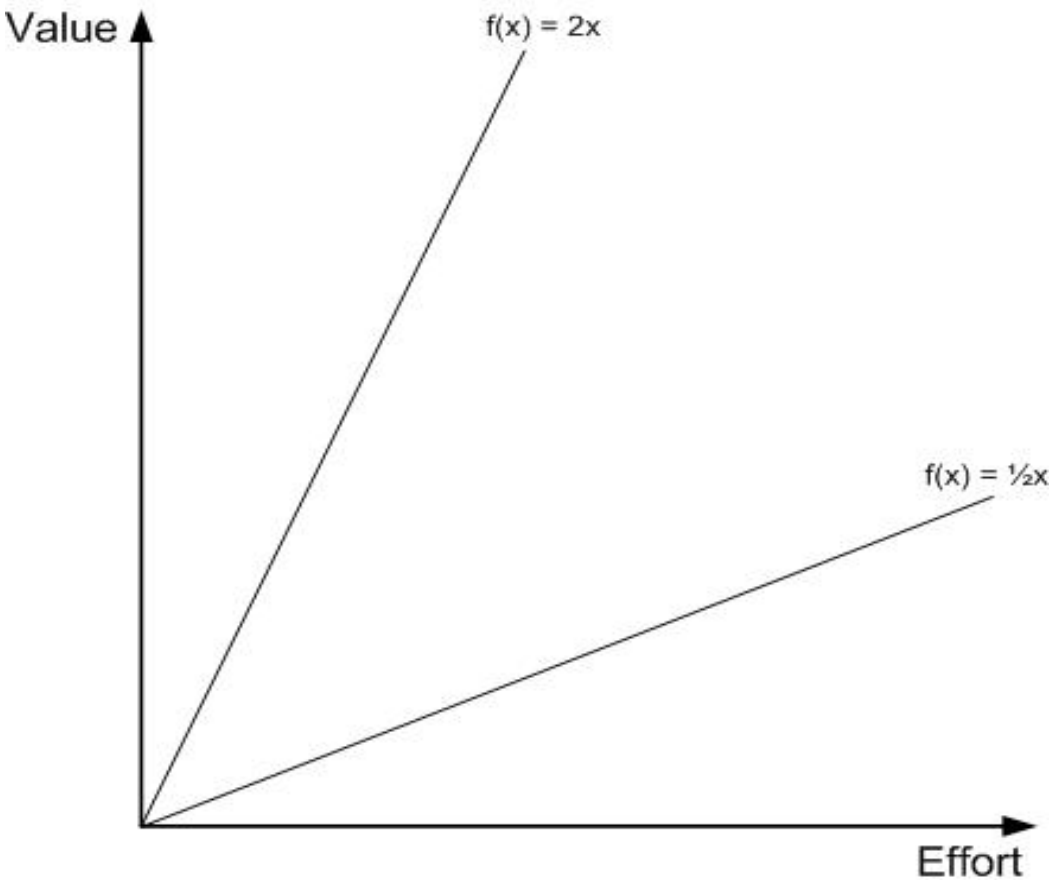
Agenda

1. Value-based Requirements Analysis
2. Organizing your Project
3. Git Tricks
4. Outlook

Value-based Requirements Analysis

- Requirements are often analyzed in a value-neutral environment
  [Boehm, Barry W. "Value-based software engineering: Overview and agenda." 2006]
- 80% of the value is expressed in 20% of the requirements (Pareto principle)
  [Koch, 1998]
- A value-oriented approach is more appropriate
- How to do that?
  - Identify the system's success-critical stakeholders
  - Obtain their value propositions with respect to the system
  - Estimate / find out value of a requirement to the stakeholders
  - Estimate effort to implement a requirement

Value-based Requirements Analysis



Rules:

- Implement: Above 2x
- Skip: Below 1/2x
- In-between: Review

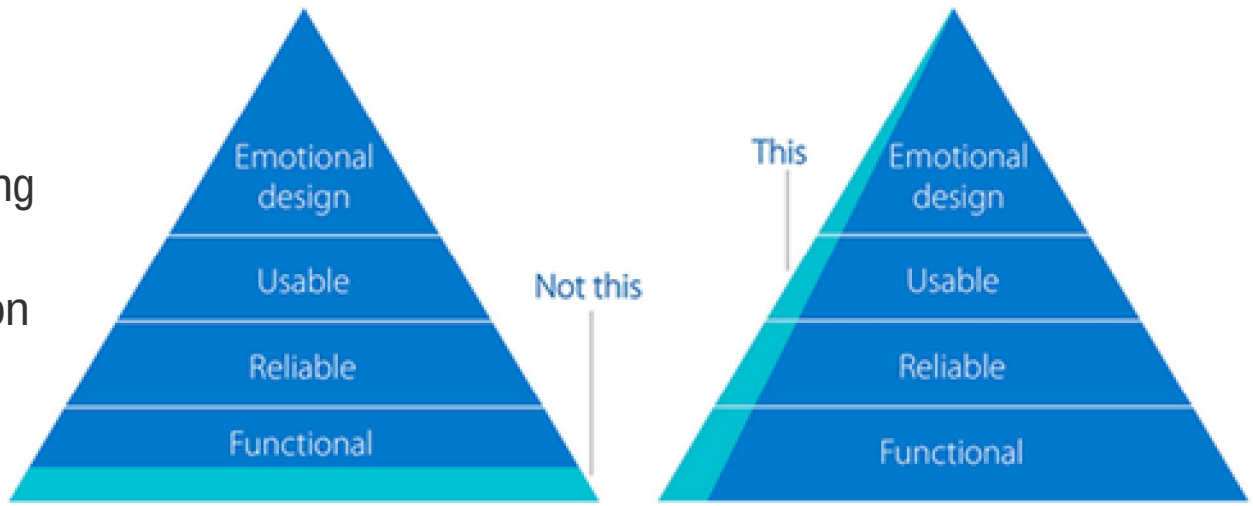
- Whole truth?
- Beware of dependencies!

Minimum Viable Product

The minimal set of features that can be useful.

Advantages

- Earlier, better user feedback
  - But can't replace rapid prototyping
- Move faster into production
  - Software is developed for a reason
- Project can no longer fail entirely



Challenges

- Requires "product" quality early on
  - No time for "and now we fix the bugs" (should not happen, anyway)
  - Also consider usability, deployment, support, marketing
- Requires smart requirement management
  - But also makes requirement management easier

Agenda

1. Value-based Requirements Analysis
2. Organizing your Project
   - Scrum Burn-Down Chart
   - Communication
   - Dealing with Dependencies
   - Estimating Large Backlogs
   - Beyond Scrum
3. Git Tricks
4. Outlook

Organizing your Project

Questions:

- Which stories are part of Sprint#1?
- Who is working on which tasks?
- Which version is a good one that can be shown to the customer?

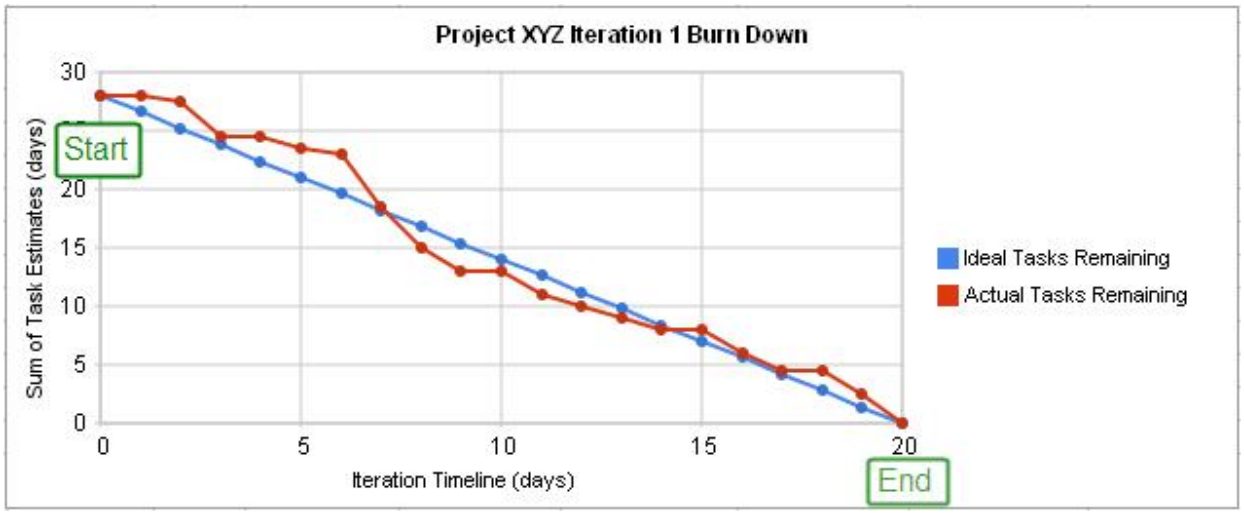
Side note:
When assigning tickets to devs it's helpful if usernames are identifiable (or there is some info on the profile).
"Who is schnuckihasi25 again?"

Tools that might help:

- Put your user stories & tasks into Github's issue tracker
  - Assign issues to developers
  - Use milestones to assign user stories to sprints
  - Use issue tags, e.g. to denote responsible teams or status
  - Use "project management" tools that give an overview of GH issues, e.g. https://waffle.io/ or https://www.zenhub.io/
- Tag versions that can be presented

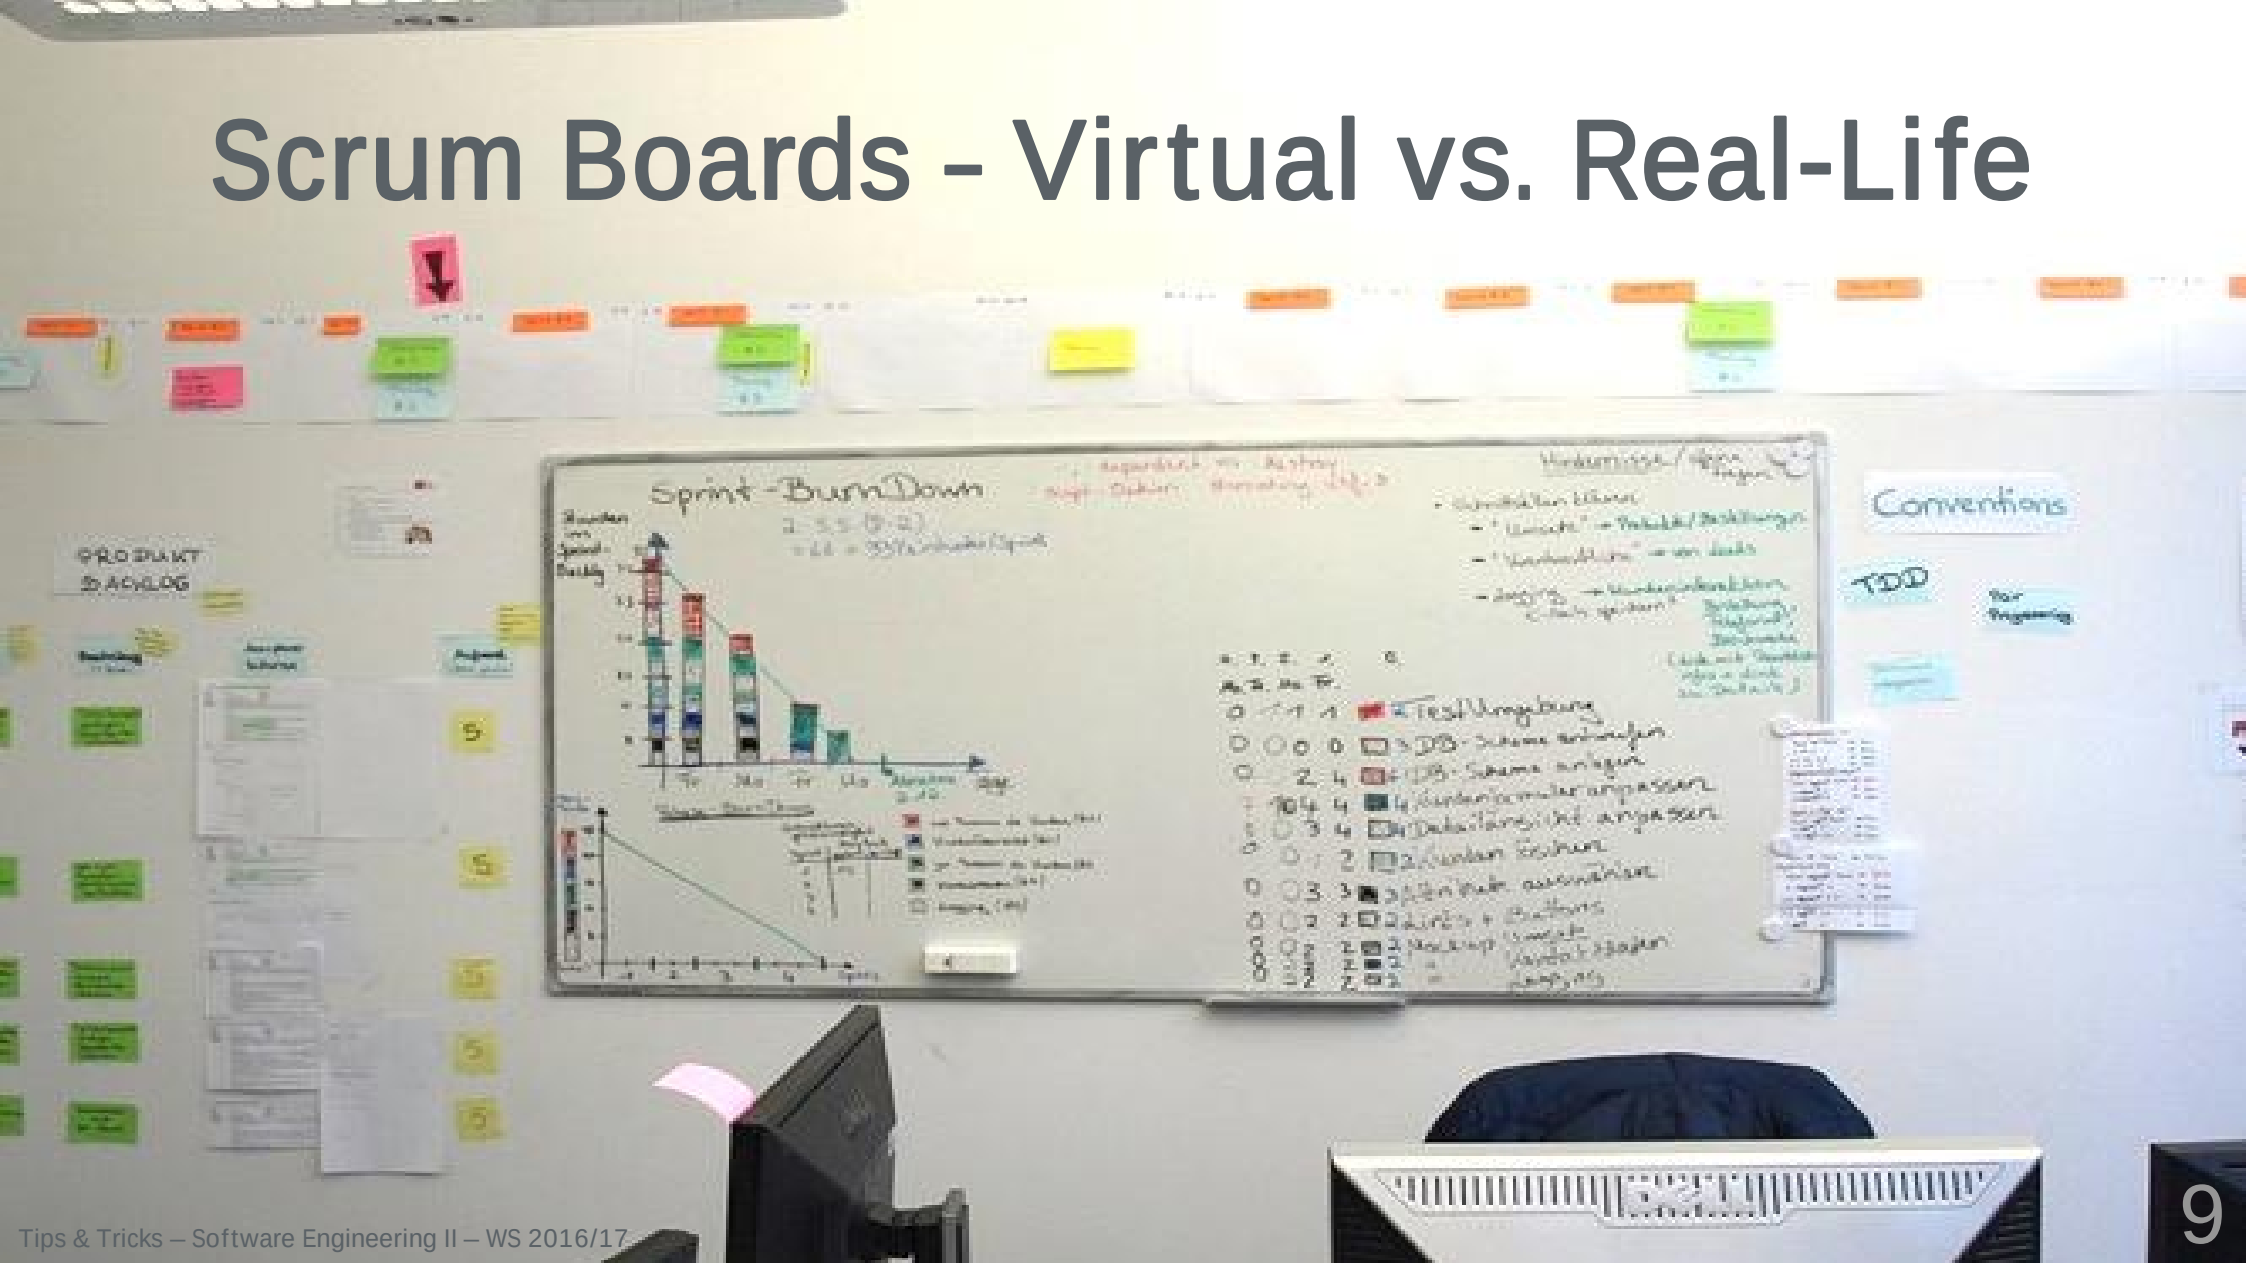
```
$ git tag –a v0.1 –m 'version after Sprint#1 without US #2'
```

Scrum Burn-Down Chart



- Graphical representation of work left to do versus time
- X-Axis: sprint timeline, e.g. 10 days
- Y-Axis: work that needs to be completed in sprint (time or story points)
- "Ideal" work remaining line: straight line from start to end
- Actual work remaing line
  - above ideal à behind schedule, below ideal à ahead schedule

Scrum Boards – Virtual vs. Real-Life



Definition of Done

How do I know when to stop?

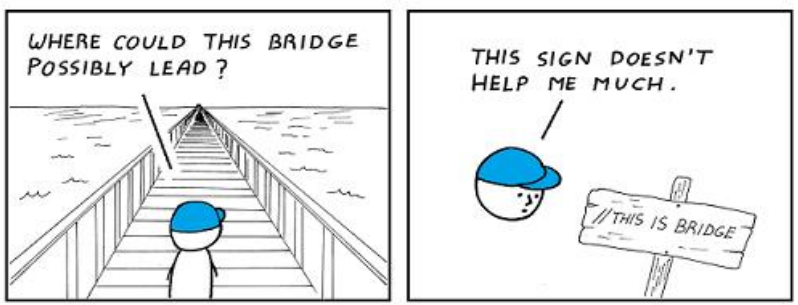
- Acceptance criteria fulfilled
- All tests are green
- Code looks good
- Objective quality goals
- Second opinion
- Internationalization
- Security
- Documentation

The Definition of Done is the team's consensus of what it takes to complete a feature.

Communication

Questions:

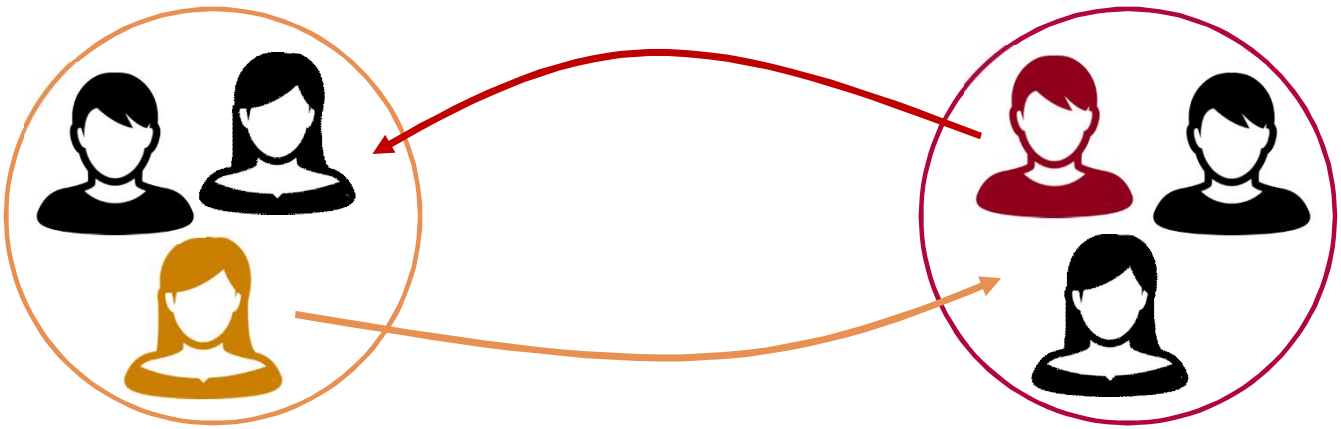
- How do we communicate in and between teams?
- How do I find out about architecture changes?
- How do I know how to use other people's code?



Tools that might help:

- Github wiki to (briefly!) document how to use components
- Code comments explaining the larger context, common pitfalls
- One(!) common communication channel for announcing changes, e.g. E-Mail list, IRC, IM, Slack, Google Hangouts, Facebook group

Dealing with Dependencies
Ambassadors



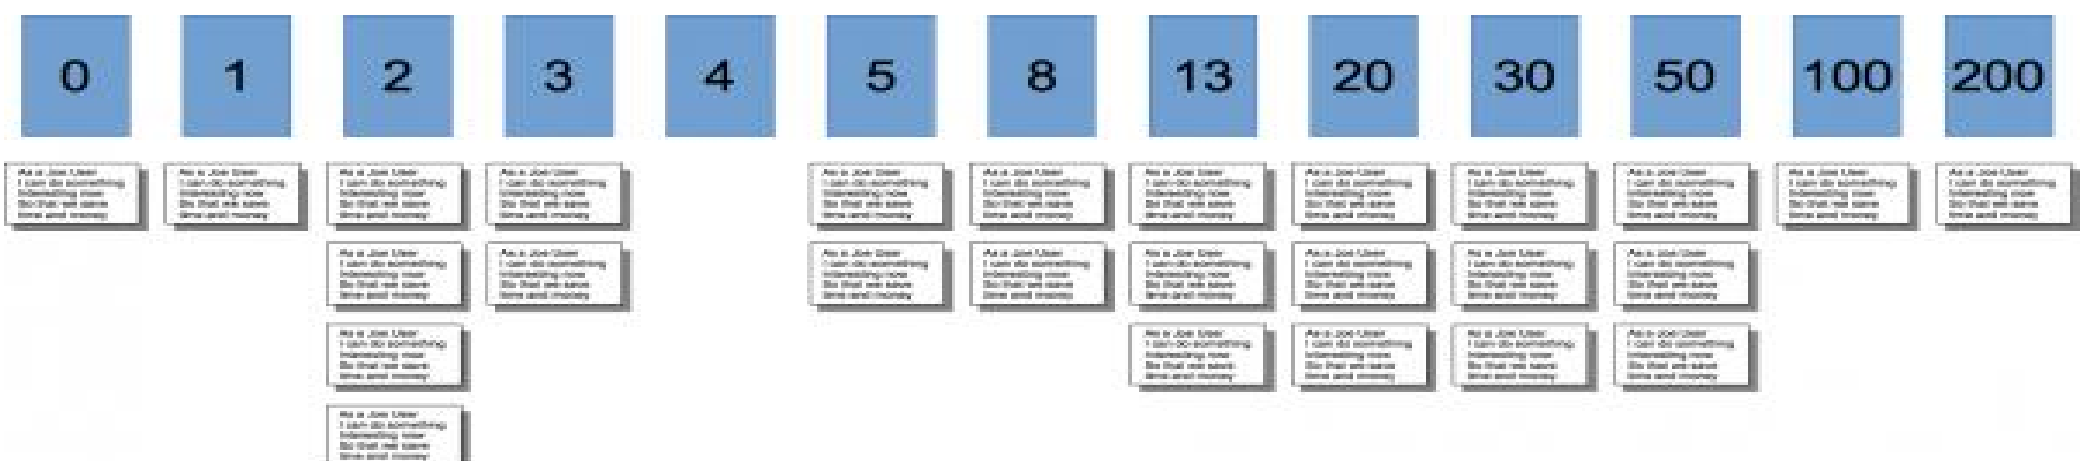
- Mutual Exchange of team members
  - Improves efficiency of communications
  - Allows deeper understanding of problems
  - Prevents coordination problems early in the process
- Ambassadors should be fully integrated team members
- Especially useful for API development, design, etc.

[Pichler, Scrum – Agiles Projektmanagement erfolgreich einsetzen, 2007]

Estimating Large Backlogs (1/2)

Bucket Estimation (Jukka Lindström) [Scrumcenter, 2009]

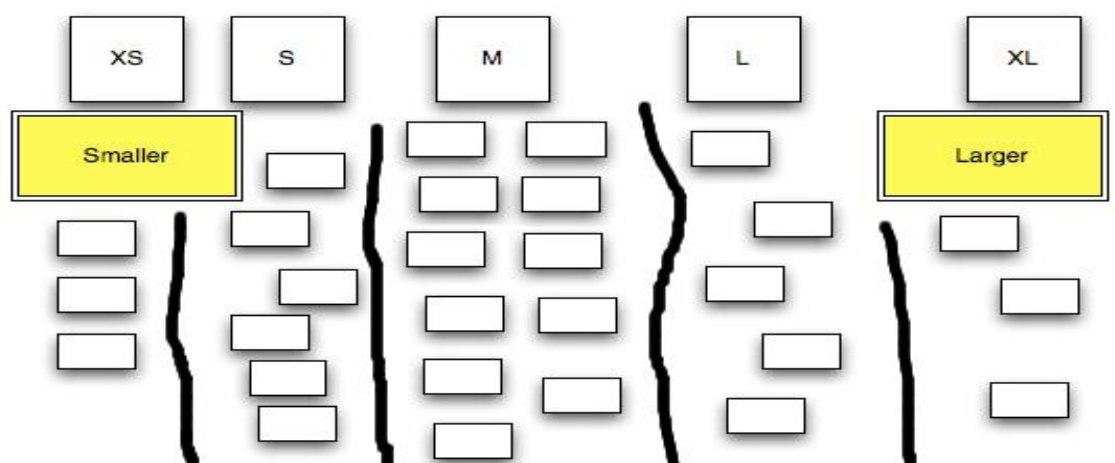
- Create physical buckets based on examples (2-3 per bucket)
- Assign items to buckets one by one through
  - Comparing & discussing
  - Planning Poker



Estimating Large Backlogs (2/2)

Affinity Estimation (Lowell Lindstrom) [Scrumcenter, 2009]

- Read each story to the entire team
- Arrange stories horizontally based on size (no talking!)
- Place Fibonacci numbers above the list
- Move each story to the preferred number



Beyond scrum

Scrum critique:

- Scrum and agile are by no means universally accepted as "the way" to do software engineering (“Agile Hangover”)
- Michael O. Church - *Why “Agile” and especially Scrum are terrible (2015)* https://michaelochurch.wordpress.com/2015/06/06/why-agile-and-especially-scrum-are-terrible/
  - *Business-driven engineering* — Scrum increases the feedback frequency while giving engineers no real power
  - *Terminal juniority* — Architecture and R&D and product development aren’t part of the programmer’s job
  - *It’s stupidly, dangerously short-term* — engineers are rewarded or punished solely based on the completion, or not, of the current two-week “sprint”

Agenda

1. Value-based Requirements Analysis
2. Organizing your Project
3. Git Tricks
4. Outlook

Git Tricks – amend, interactive staging

Change commit message of previous commit
(Careful, don't do this if you already pushed the commit)

```
$ git commit --amend -m "new message"
```

Forgot to commit files?

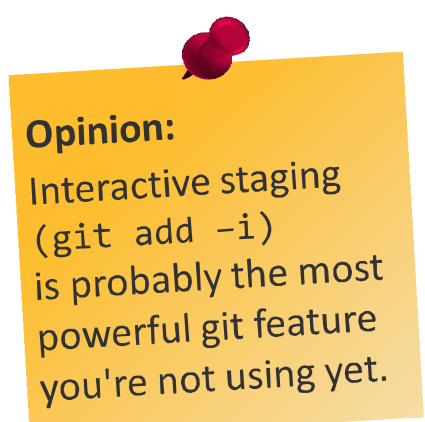
```
$ git add [missing files]
$ git commit --amend  #uses the previous commit's message
```

Undo the amending

```
$ git reset --soft HEAD@{1}
$ git commit -C HEAD@{1}
```

Interactive staging (also allows committing only parts of files)

```
$ git add -i
$ git add --patch [file]
```



Git Tricks – reflog, diff, stash

Log of all recent actions

```
$ git reflog
```

What did I work on recently?

Show differences that are not staged yet

```
$ git diff
```

Shows differences between staging and the last file version

```
$ git diff --staged
```

Temporarily store/retrieve all modified tracked files

```
$ git stash
$ git stash pop
```

List all stashed changesets

```
$ git stash list
```

Tip:

`git stash` is often helpful if you don't want to directly commit your changes, but need to checkout another branch/commit.

Git Tricks – log, blame, rebase

Shorter version of the git log

```
$ git log --abbrev-commit --pretty=oneline
```

Show pretty graph of git history

```
$ git log --graph --decorate --pretty=oneline --abbrev-commit
```

Show changesets in the log

```
$ git log -p
```

Show what revision and author last modified each line

```
$ git blame --date=short [file]
```

History is becoming cluttered with merge commits

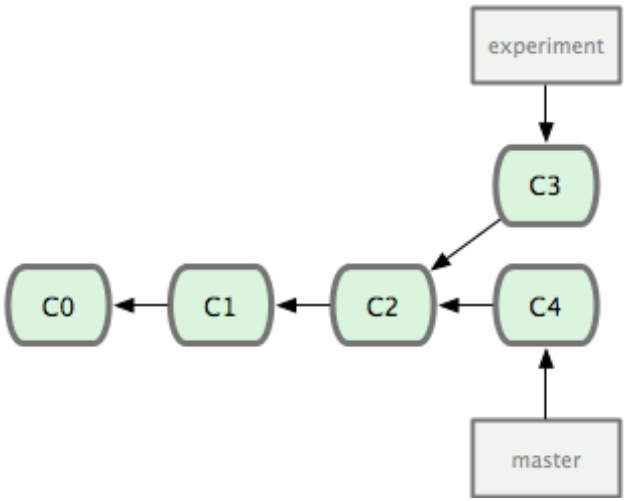
```
$ git rebase <branch>
```

Warning:
Do not rebase commits that others have worked with!
"people will hate you, and you'll be scorned by friends and family."
https://git-scm.com/book/en/v1/Git-Branching-Rebasing#The-Perils-of-Rebasing

Git Rebase – setup

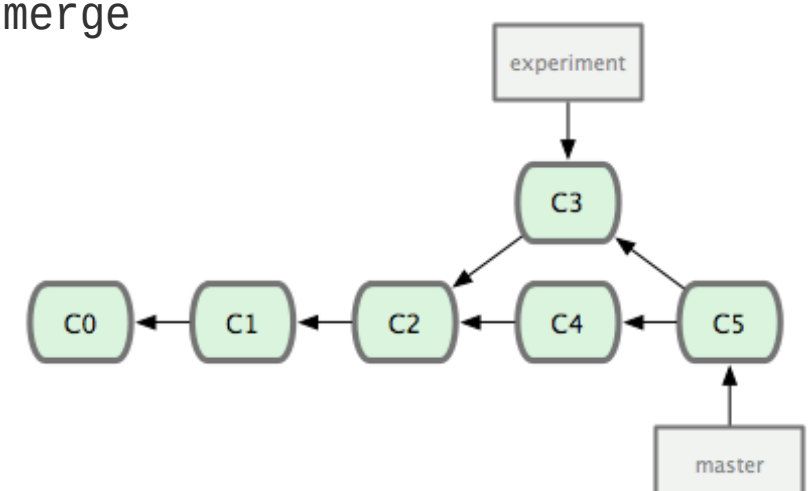
- Created "experiment" branch to try something out

```
$ git checkout –b "experiment"
$ git commit –a –m "C3"
```



- Easiest way to integrate the branches is `merge`
  - Will create merge commits

```
$ git checkout master
$ git merge experiment
```

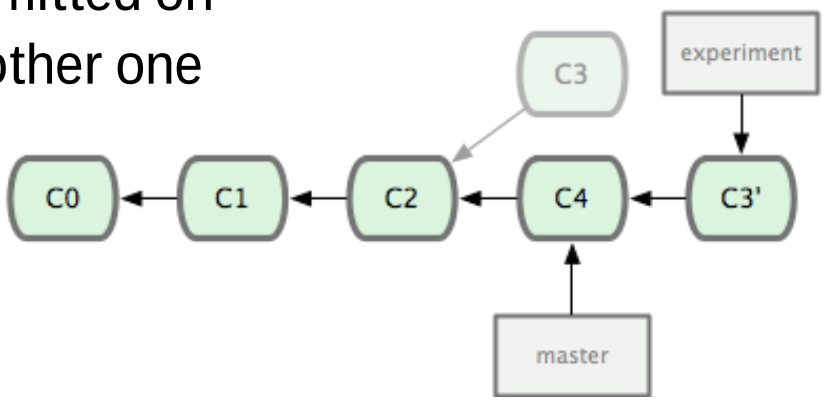


https://git-scm.com/book/en/v1/Git-Branching-Rebasing (MIT)

Git Rebase – execution

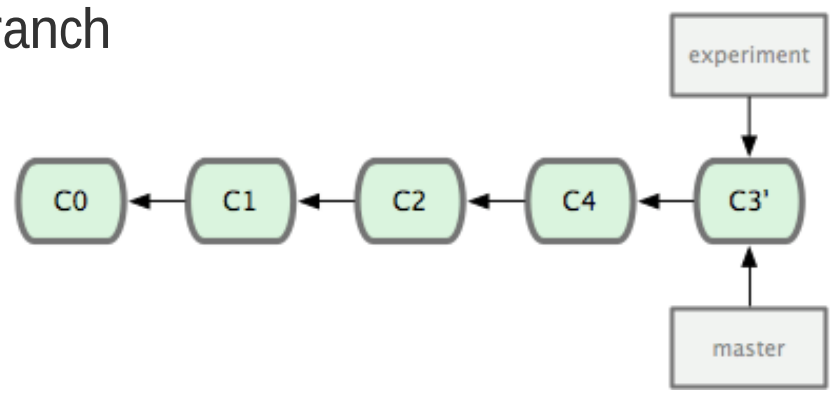
- `git rebase`
  - Take all the changes that were committed on one branch and replay them on another one
  - Only do this with local commits

```
$ git checkout experiment
$ git rebase master
```



- Afterwards: fast-forward the master branch
  - No merge commits

```
$ git checkout  master
$ git merge experiment
```



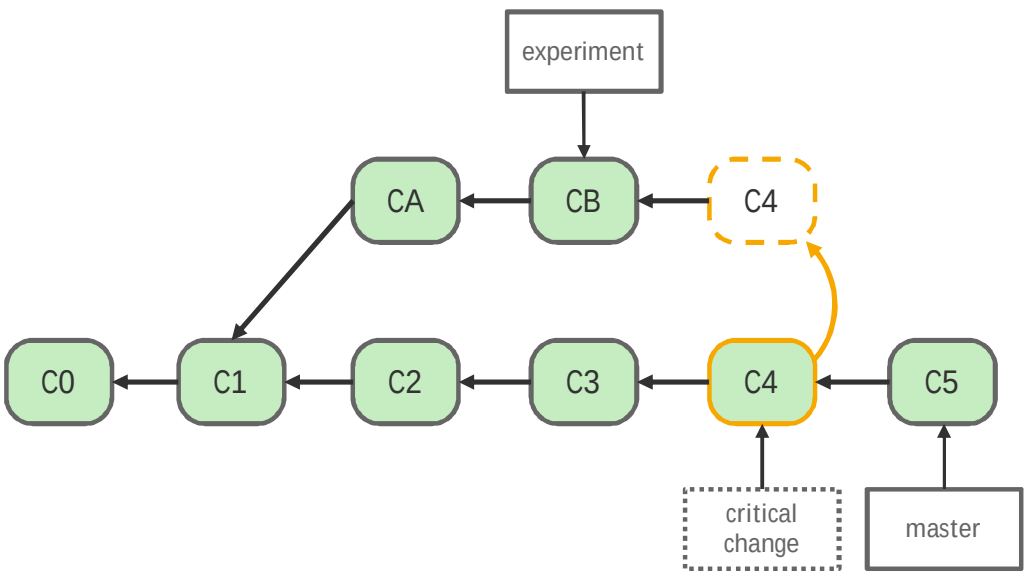
https://git-scm.com/book/en/v1/Git-Branching-Rebasing (MIT)

Git cherry-pick

- Problem: Quickly get changes from other commits without having to merge entire branches
- `git cherry-pick`
  - apply the changes introduced by existing commits

```
$ git checkout master
$ git log --abbrev-commit --pretty=oneline
d7ef34a C3: Implement feature
0be778a C4: critical change introduced
```

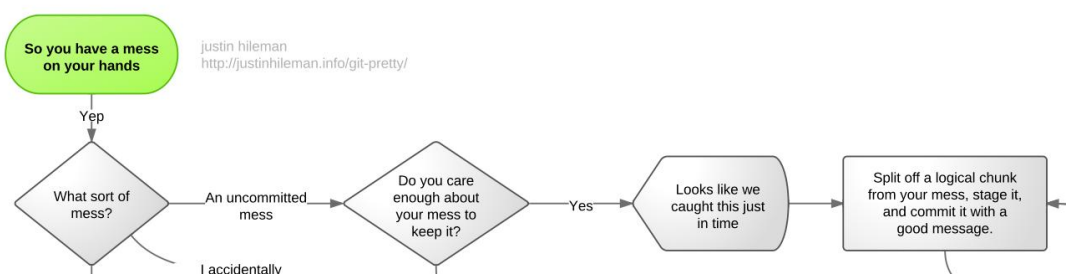
```
$ git checkout experiment
$ git cherry-pick 0be778a
```



https://git-scm.com/book/en/v1/Git-Branching-Rebasing (MIT)

Git Self-help Resources

- How to undo (almost) anything with git – guide by Github
  - https://github.com/blog/2019-how-to-undo-almost-anything-with-git one
- Git cheat sheet – by Github
  - https://training.github.com/kit/downloads/github-git-cheat-sheet.pdf
- Git FAQ – answers to common questions
  - http://gitfaq.org/
  - https://git.wiki.kernel.org/index.php/Git_FAQ
- Git pretty – troubleshooting flowchart
  - http://justinhileman.info/article/git-pretty/



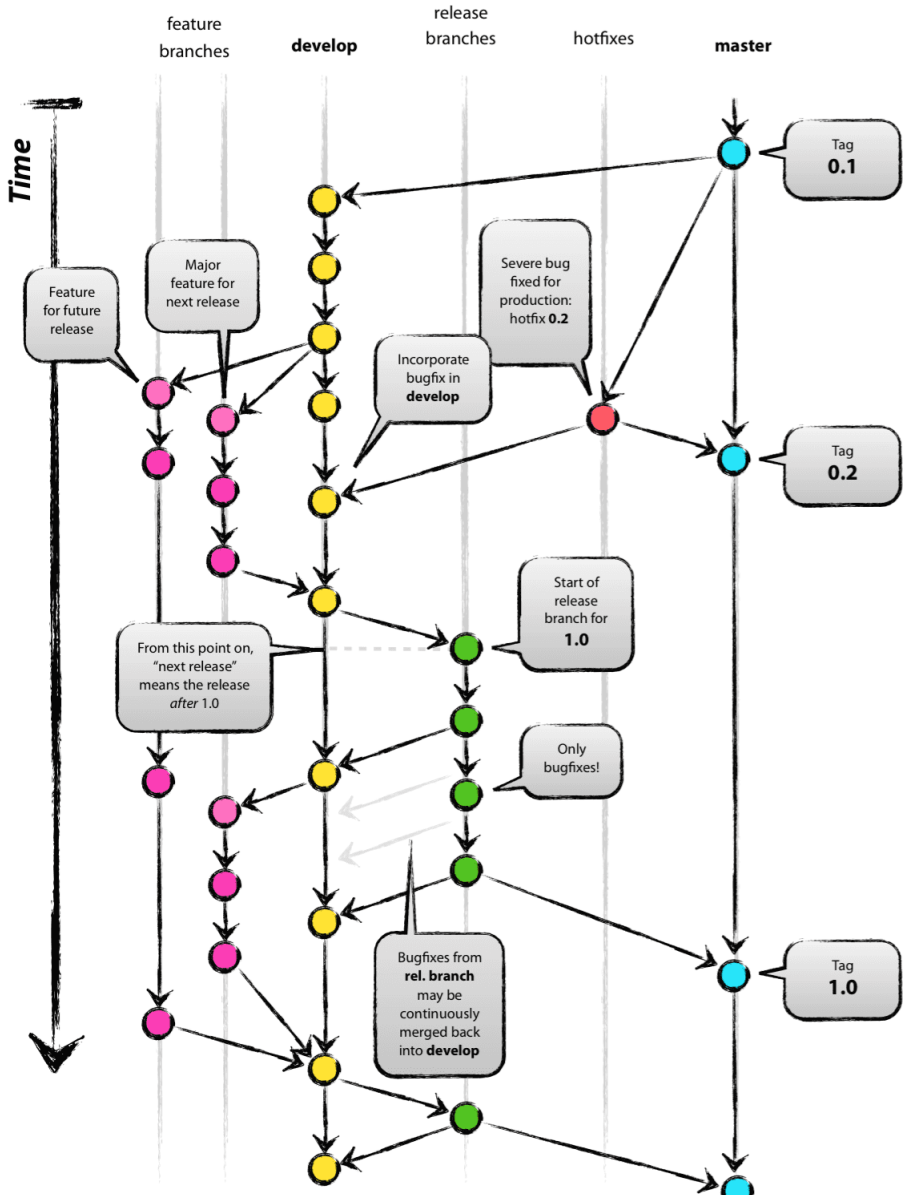
Tooling suggestions

- Many GUIs for git available (https://git-scm.com/downloads/guis)
  - Make some complex git interactions much simpler
  - Draw pretty commit graphs, overviews of branches and merges
  - *GitX, TortoiseGit, SourceTree, Tower, SmartGit, gitg, git-cola*
- Github Integration
  - Github also provides git tools
    https://mac.github.com/, https://windows.github.com/
- Git extras (https://github.com/tj/git-extras)
  - Common git commands bundled

Branching

- http://nvie.com/posts/a-successful-git-branching-model/

- Never merge in master or release branches
- Never break build in shared branches



Agenda

1. Value-based Requirements Analysis
2. Organizing your Project
3. Git Tricks
4. Outlook

Outlook

Dec 18

- Present your intermediate results

Jan 15 & 22

- Guest lectures
