PhD Student

Slide 2

# Distributed Machine Learning

## Parallelism of training

1. Model

2. Data

3. Worker

### Data-Parallel

### Model-Parallel

# Distributed Machine Learning

## Parallelism of training

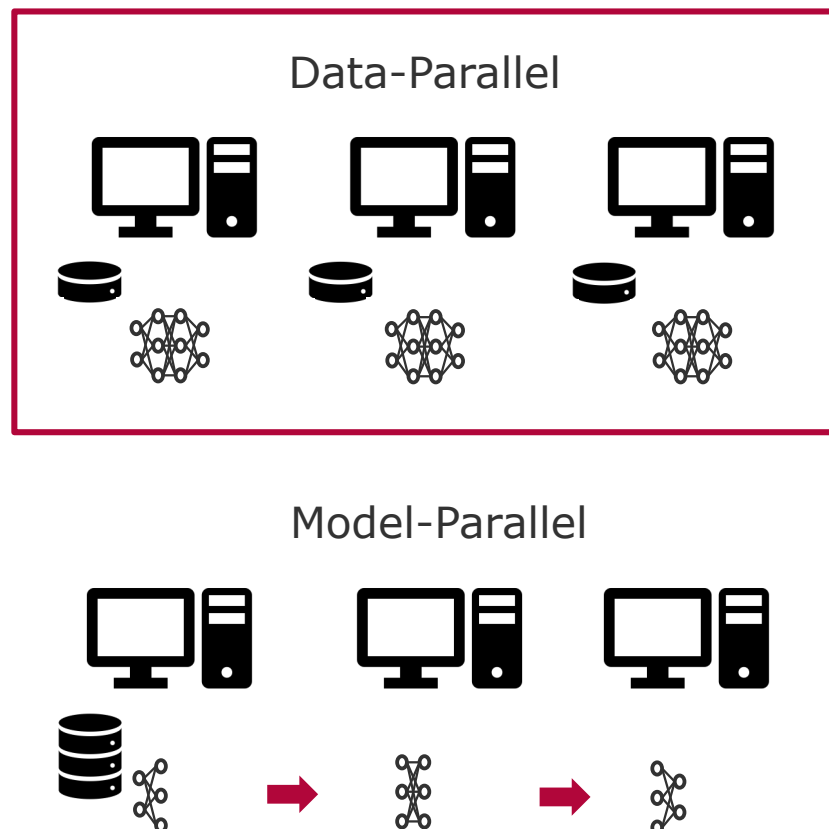

1. Model

2. Data

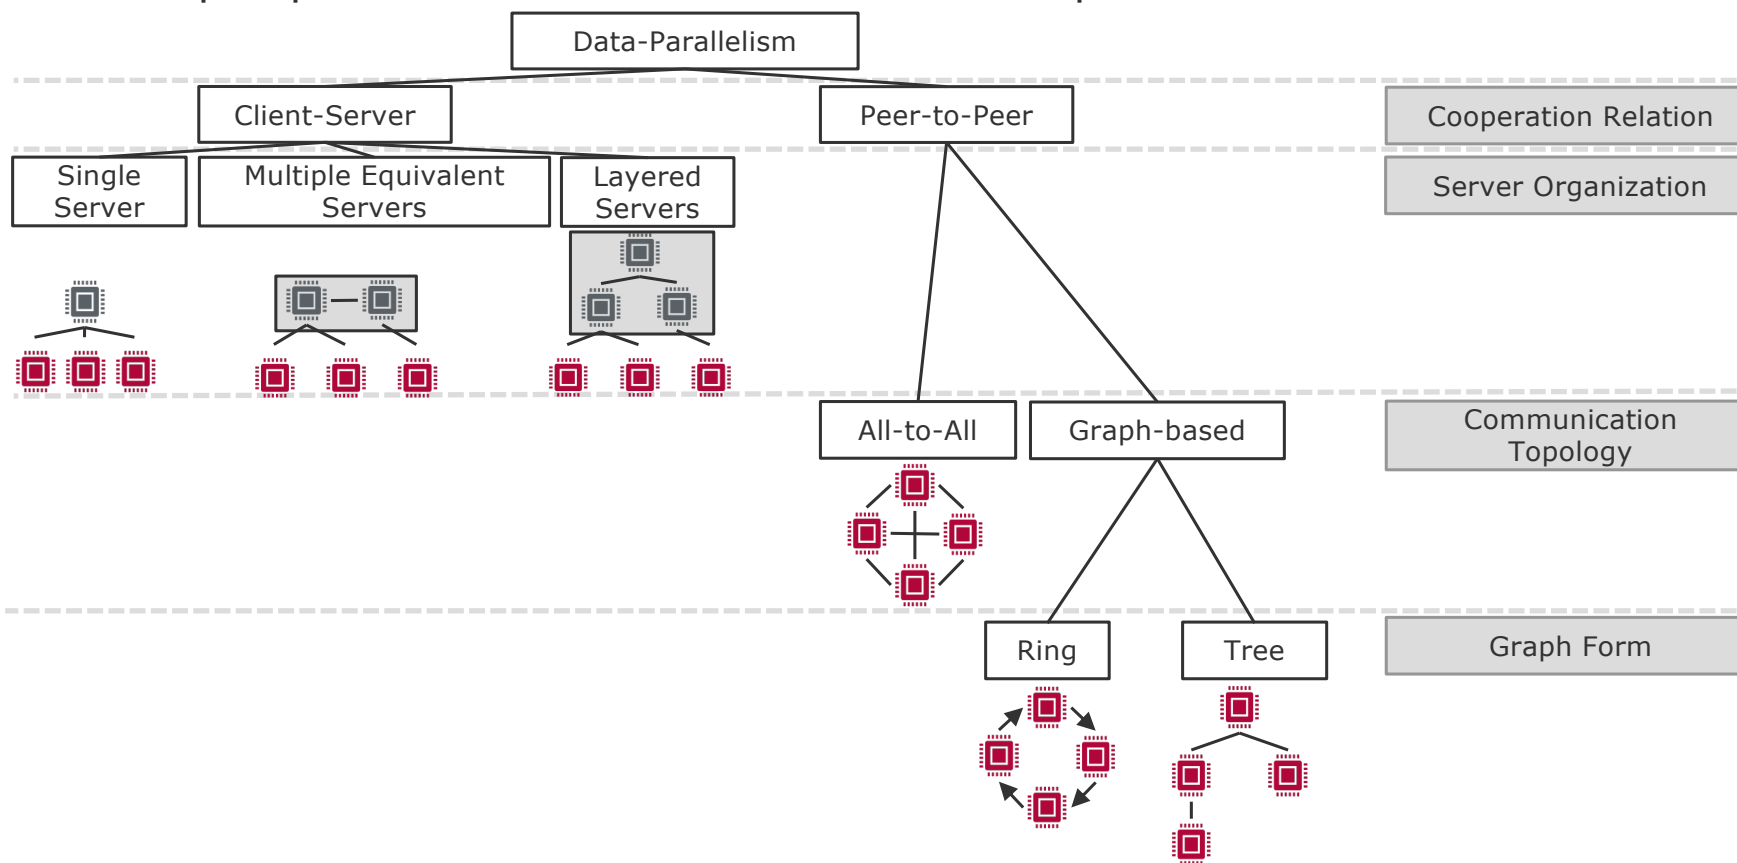

3. Worker

# Data-parallel training architectures

From perspective of communication relationship:

Leonard Paeleke,  
PhD Student

Slide 4

# Data-parallel training architectures

## 1. Parameter Server

- Client-Server architecture: *Workers* synchronize via centralized server (*parameter server*)
- *Parameter server*: maintains and distributes model and data, and aggregates updates
- *Worker*: processes assigned data, computes updates and sends updates to the *parameter server*

# Data-parallel training architectures

1. Parameter Server
2. In-Network Aggregation
  - Client-Server architecture
  - Network infrastructure act as centralized server and synchronizes workers

# Data-parallel training architectures

1. Parameter Server
2. In-Network Aggregation
3. Federated Learning
  - Client-Server architecture
  - Data is stored locally and not exchanged
  - Designed for edge-servers and smartphones

# Data-parallel training architectures

1. Parameter Server
2. In-Network Aggregation
3. Federated Learning
4. All-Reduce

- Peer-to-Peer architecture: *Workers* synchronize with peers through direct communication
- Several communication topologies possible: E.g., All-to-All, Butterfly or Ring.

---

# Impact of data-parallel architecture on training

---

Differences of architectures:

- Data distribution
- Straggler handling
- Communication effort
- Computational effort

Leonard Paeleke,  
PhD Student

- Data distribution
- Straggler handling
- Communication effort
- Computational effort

## Impacts on training:

- Order of updates
  - Age of information
  - Time to convergence
  - Energy consumption
- } Model quality

## How to select an architecture for a learning task?

### Common metrics:

- Model quality
- Training time
- Resource consumption
- Energy consumption
- Green house emission

Leonard Paeleke,  
PhD Student

Slide 9

# Survey - Approach

- Studies evaluate training of ML models for several learning tasks and data-parallel architectures
- Metrics: Model quality or training time

TABLE I: Model quality of distributed ML architectures on typical ML applications

|                                     | Parameter Server           | In-network Aggregation | Federated Learning | All-reduce approach         |
|-------------------------------------|----------------------------|------------------------|--------------------|-----------------------------|
| img trans                           |                            |                        |                    |                             |

Slide 10

---

# Survey - Results

---

## Model quality:

- In many studies Client-Server architectures outperform Peer-to-Peer
- Federated Learning rarely compared to other architectures

## Training time:

- Different measures used, e.g., wall-clock time and CPU time
- Improvements by reducing:
  - Communication overhead
  - Waiting time for stragglers
  - Time for parameter aggregation

Leonard Paeleke,  
PhD Student

Slide **11**

---

# Survey - Results

---

## Challenges:

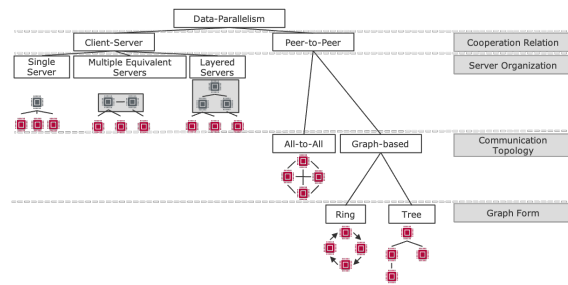

- Comparability between studies
- Lack of definitions, e.g., completion of training

## Suggestion:

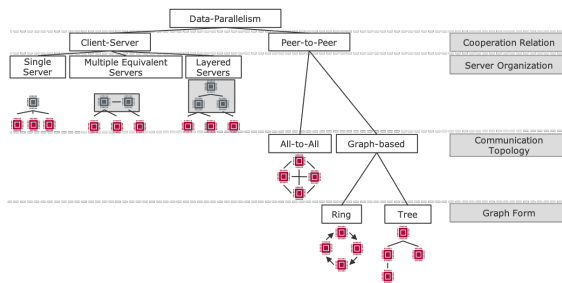

- Reference learning task with predefined model, hyperparameters, data set, fixed train-test split, and measurement for model quality
- Definition of training time
- Normalizing testbed by speed of CPUs/ GPUs

Leonard Paeleke,  
PhD Student

Slide **12**

## Architecture impact training in

- Order of updates
- Age of information
- Time to convergence
- Energy consumption

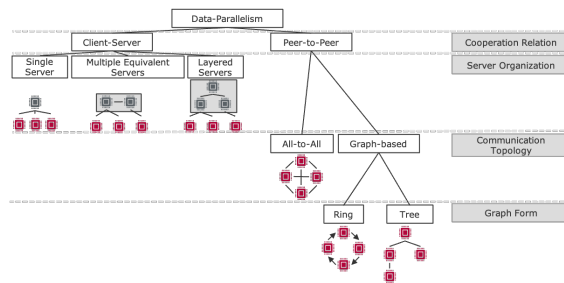

## Architecture impact training in

- Order of updates
- Age of information
- Time to convergence
- Energy consumption

## Open question:

- Which data-parallel architecture to choose for a learning task?

## Architecture impact training in

- Order of updates
- Age of information
- Time to convergence
- Energy consumption

## Open question:

- Which data-parallel architecture to choose for a learning task?

## Identified problem:

- Comparability of studies

## Architecture impact training in

- Order of updates
- Age of information
- Time to convergence
- Energy consumption

## Open question:

- Which data-parallel architecture to choose for a learning task?

## Identified problem:

- Comparability of studies

## Suggestion:

- Reference testbed
- Normalization of training

## Architecture impact training in
