Perscheid

Slide 4

Lecture Organization

Goals

Understand...

- opportunities of causal inference
- the mathematical concepts
- challenges and problems in the context of real-world applications
- constraint-based algorithms to derive causal relationships

Do...

- work in small teams
- work on a specific topic in the context of data-driven causal inference
- implement algorithms and analyze performance results
- write a scientific report

Improve...

- mathematical, analytical, and modeling skills
- scientific working and writing
- machine learning techniques

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 5

Lecture Organization

Schedule (I/II)

■ **April 28 – May 27: Lecture Period**

- Learn theoretical basis of
 - Causal Graphical Models (*May 05*)
 - Conditional Independence Testing (*May 12*)
 - Causal Structure Learning (*May 19*)
 - Do-Calculus of Intervention (*May 26*)
- Tuesday: Topic related lectures
- Wednesday: If needed Q&A + Additional information + Exercises

■ **May 13: Topic Assignments**

- Topic introduction (*May 05*)
- Form groups and apply for topics: *until Sun May 10, 11:59 PM*
- Assignment (*May 13*)

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegler,
Perscheid

Lecture Organization

Schedule (II/II)

■ **May 13 - June 09: Training Period and Intermediate Presentations**

- Get familiar to your topic
- If needed Q&A and individual meetings with supervisors
- Present your topic, first results, challenges, and solution ideas (*June 09*)

■ **June 10 - July 08: Elaboration Period and Final Presentations**

- Realization and implementation
- If needed Q&A and individual meetings with supervisors
- Present your results, open challenges, and solution ideas (*July 07 or 08*)

■ **July 09 – August 31: Scientific Writing Period**

- Write scientific report on your findings, incorporate feedback and finalize work
- Submission: *August 10 11:59 PM*
- Peer-Review Submission: *August 17, 11:59 PM*
- Final Submission: *August 31, 11:59 PM*

Lecture Organization

Grading

- Credits:
 - 6 graded ECTS
- The grading of the seminar works as follows (aka “Leistungserfassungsprozess”):
 - **50%** intermediate and final presentation of implementation results
 - **40%** scientific research article
 - **10%** personal engagement
- **All individual parts have to be passed** to pass the complete lecture

Storks Deliver Babies ($p= 0.008$)

Robert Matthews

First published: 25 December 2001

<https://doi.org/10.1111/1467-9639.00013>

Cited by:20

Abstract

This article shows that a highly statistically significant correlation exists between stork populations and human birth rates across Europe. While storks may not deliver babies, unthinking interpretation of correlation and p-values can certainly deliver unreliable conclusions.

Amazon's recommendation system – is it crazy?

Posted on January 12th, 2008 in [business](#) , [Humor](#) , [technology](#) , [wonder why](#) - 6 comments

We have a saying in *Telugu* that goes like this, "thaadu vundhi kada ani eddu kontama?" which means, "just because you have a rope you dont buy a bullock to tie". Amazon's recommendation system must have been coded by someone with a skewed view of reality. How else can you explain this?

Obviously I didnt purchase neither the bag nor the laptop... but nevertheless I had a good laugh. I am not sure if it would behave if you access the link again, but here it is if you are curious. [\[Amazon.com: Mobile Edge Express Backpack-Black-MEBPE2: Electronics\]](#)

Causality: An Ubiquitous Notion

Ann Emerg Med. 2017 Jan;69(1):62-72. doi: 10.1016/j.annemergmed.2016.08.007. Epub 2016 Sep 28.

The Effect of Combined Out-of-Hospital Hypotension and Hypoxia on Mortality in Major Traumatic Brain Injury.

Spaite DW¹, Hu C², Bobrow BJ³, Chikani V⁴, Barnhart B⁵, Gaither JB⁶, Denninghoff KR⁶, Adelson PD⁷, Keim SM⁶, Viscusi C⁶, Mullins T⁸, Sherrill D⁹.

Author information

Abstract

STUDY OBJECTIVE: Survival is significantly reduced by either hypotension or hypoxia during the out-of-hospital management of major traumatic brain injury. However, only a handful of small studies have investigated the influence of the combination of both hypotension and hypoxia occurring together. In patients with major traumatic brain injury, we evaluate the associations between mortality and out-of-hospital hypotension and hypoxia separately and in combination.

METHODS: All moderate or severe traumatic brain injury cases in the preimplementation cohort of the Excellence in Prehospital Injury Care study (a statewide, before/after, controlled study of the effect of implementing the out-of-hospital traumatic brain injury treatment guidelines) from January 1, 2007, to March 31, 2014, were evaluated (exclusions: <10 years, out-of-hospital oxygen saturation ≤10%, and out-of-hospital systolic blood pressure <40 or >200 mm Hg). The relationship between mortality and hypotension (systolic blood pressure <90 mm Hg) or hypoxia (saturation <90%) was assessed with multivariable logistic regression, controlling for Injury Severity Score, head region severity, injury type (blunt versus penetrating), age, sex, race, ethnicity, payer, interhospital transfer, and trauma center.

RESULTS: Among the 13,151 patients who met inclusion criteria (median age 45 years; 68.6% men), 11,545 (87.8%) had neither hypotension nor hypoxia, 604 (4.6%) had hypotension only, 790 (6.0%) had hypoxia only, and 212 (1.6%) had both hypotension and hypoxia. Mortality for the 4 study cohorts was 5.6%, 20.7%, 28.1%, and 43.9%, respectively. The crude and adjusted odds ratios for death within the cohorts, using the patients with neither hypotension nor hypoxia as the reference, were 4.4 and 2.5, 6.6 and 3.0, and 13.2 and 6.1, respectively. Evaluation for an interaction between hypotension and hypoxia revealed that the effects were additive on the log odds of death.

CONCLUSION: In this statewide analysis of major traumatic brain injury, combined out-of-hospital hypotension and hypoxia were associated with significantly increased mortality. This effect on survival persisted even after controlling for multiple potential confounders. In fact, the adjusted odds of death for patients with both hypotension and hypoxia were more than 2 times greater than for those with either hypotension or hypoxia alone. These findings seem supportive of the emphasis on aggressive prevention and treatment of hypotension and hypoxia reflected in the current emergency medical services traumatic brain injury treatment guidelines but clearly reveal the need for further study to determine their influence on outcome.

Words Matter: Researchers Should Avoid Implying Causation in Studies of Association

Joshua S. Broder, MD

Abstract Full Text References

To the Editor:

I read with interest the article by Spaite et al.¹ The authors should be commended for a carefully conducted analysis of the association between survival after major traumatic brain injury and the combination of hypoxia and hypotension. However, even with attempts to statistically isolate hypoxia and hypotension from confounding variables such as injury severity, this nonrandomized cohort study cannot determine causation, which is implied by the title (“The Effect of Combined Out-of-Hospital Hypotension and Hypoxia on Mortality in Major Traumatic Brain Injury”), the abstract, the article, and the Editor’s Capsule Summary (“what is the effect on survival of the combination of hypotension and hypoxia compared with either factor alone?”).

Although this may appear to be a semantic or minor concern, appropriate terminology in describing research methods, results, and conclusions is of fundamental importance. The history of medicine illustrates the potential harms of misconstruing an association as a causal relationship and acting (with good intentions) to reduce a misperceived effect. For example, estrogen replacement was falsely identified as the cause of improved women’s cardiovascular health according to associations from observational cohort studies; prospective randomized controlled trials demonstrated harms from this therapy.²⁻⁵

Causal Inference Theory and Applications in Enterprise Computing

in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 13

2. A Short History

Causality in Philosophy

The subject of causality has a long history in philosophy.

*"...Thus we remember to have seen that species of object we call flame, and to have felt that species of sensation we call heat. We likewise call to mind their **constant conjunction in all past instances**. Without any farther ceremony, we call the one **cause** and the other **effect**, and infer the existence of the one from that of the other."*

Perscheid

Slide 15

2. A Short History

Causality in Philosophy

Some philosophers even proposed to abandon the concept of causality completely.

*"All philosophers [...] imagine that causation is one of the fundamental axioms or postulates of science, yet, oddly enough, in advanced sciences such as gravitational astronomy, the word **'cause'** never occurs. The law of **causality**, I believe, like much that passes muster among philosophers, is **a relict of a bygone age**, surviving, like the monarchy, only because it is erroneously supposed to do no harm."*

Bertrand Russell, On The Notion Of Cause (1912)

Causal Inference

Slide **16**

2. A Short History Causality in Statistics

Challenge in statistics: Draw conclusions from data

■ James Lind (1716-1794): **How to treat scurvy?**

- Scurvy results from a lack of vitamin C
- 12 scorbutic sailor treated with different acids, e.g. vinegar, cider, lemon
- Only the condition of the sailor treated by lemon improved

- *"If your experiment needs statistics, you ought to have done a better experiment."*
Ernest Rutherford (1871-1937)

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 17

2. A Short History

Causality in Statistics

But: What if you cannot do a *randomized experiment* or receive ambiguous results?

Use statistical tests to validate your hypothesis

Check whether it is statistically significant that
 $P(\text{recovery} \mid \text{lemons}) > P(\text{recovery} \mid \text{no lemons})$

Or in other words:

"Is there a dependence (!!!) between recovery and the treatment with lemons?"

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide **18**

2. A Short History

Causality in Statistics

*"Beyond such discarded fundamentals as 'matter' and 'force' lies **still another fetish** amidst the inscrutable arcana of even modern science, namely, **the category of cause and effect.**"*

Karl Pearson (1857-1936)

Correlation does not imply causation.

Since then, many statisticians tried to avoid causal reasoning

- *"Considerations of causality should be treated as they have always been in statistics: preferably not at all."* (Terry Speed, 1990)
- *"It would be very healthy if more researchers abandon thinking of and using terms such as cause and effect."* (Bengt Muthen, 1987)

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide **19**

2. A Short History

Causality in Statistics

But dependence says us something about causation:

If there is a statistical dependence between variables X and Y , e.g.,

then either

- X causally influences Y (or vice versa), e.g.,
- or there exists Z causally influencing both, e.g.,

“Common Cause Principle”

3. A Paradigm Shift

The Idea: Plato's Allegory of the Cave

**Do not model the distribution of the data
but model the mechanisms that generated the data!**

**Causal Inference
Theory and Applications
in Enterprise Computing**

Hagedorn, Huegle,
Perscheid

Slide 21

3. A Paradigm Shift

Basic Contributions

- The modeling of the underlying structures provides a language to encode causal relationships – the basis of a **causality theory**.
- Causality theory helps to decide when, and how, causation can be inferred from domain knowledge and data.

Some people who contributed to causality theories:

Donald Rubin
(*1943)

Judea Pearl
(*1936)

Donald Campbell
(1916-1996)

Dawid Philip
(*1946)

Clive Granger
(1934-2009)

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

"[...] all approaches to causation are variants or abstractions of [...] structural theory [...]." Judea Pearl

3. A Paradigm Shift

Structural Causal Models

Judea Pearl

Slide 26

5. The Calculus of Causality

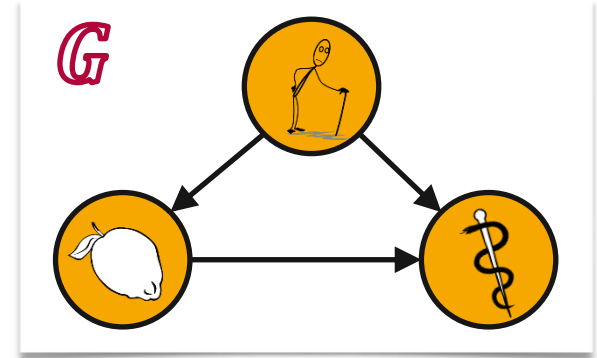

Causal Inference: How to Build a Formal Theory?

“Causality, although widely used, does not seem to be well-defined”
(Lindley and Novick, 1981)

Problem: Probability theory has an associational, and not a causal nature.

To see this:

- Recap the scurvy experiment
- Assume that the data is generated by model G .
 - The **recovery** of the scurvy is causally influenced by the **treatment with lemons**.
 - But now, both the **recovery** of scurvy as well as the **treatment with lemons** are causally influenced by the **age of the sailors**.
- The question remains:

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 27

Should we treat scurvy with lemons?

5. The Calculus of Causality

The Associational Nature of Probability Theory

- We run an experiment w.r.t. the model \mathcal{G} , i.e., we favor old sailors for treatment with lemons.
- The observed data of all sailors:

| Combined | Recovery | No Recovery | Total | Recovery Rate |
|-----------|----------|-------------|-------|---------------|
| No lemons | 20 | 20 | 40 | 50 % |
| Lemons | 16 | 24 | 40 | 40 % |
| Total | 36 | 44 | 80 | |

- Hence, we see that
 $P(\text{recovery}|\text{lemons}) < P(\text{recovery}|\text{no lemons})$

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 28

➔ Should we treat scurvy with lemons?

5. The Calculus of Causality

The Associational Nature of Probability Theory

- The observed data of old sailors:

| Old | Recovery | No Recovery | Total | Recovery Rate |
|-----------|----------|-------------|-------|---------------|
| No lemons | 2 | 8 | 10 | 20 % |
| lemons | 9 | 21 | 30 | 30 % |
| Total | 11 | 29 | 40 | |

→ $P(\text{recovery}|\text{lemons}, \text{old}) > P(\text{recovery}|\text{no lemons}, \text{old})$

- The observed data of young sailors:

| Young | Recovery | No Recovery | Total | Recovery Rate |
|-----------|----------|-------------|-------|---------------|
| No lemons | 18 | 12 | 30 | 60 % |
| Lemons | 7 | 3 | 10 | 70 % |
| Total | 25 | 15 | 40 | |

→ $P(\text{recovery}|\text{lemons}, \text{young}) > P(\text{recovery}|\text{no lemons}, \text{young})$

→ Should we treat scurvy with lemons?

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 29

5. The Calculus of Causality

Pearl's Contribution: The do-operator

- This reversal of the association between two variables after considering the third variable is called **Simpson's Paradox**.
- ➔ How to resolve the paradox and find an answer?

- In an interventional regime, all influences stemming from "natural causes" of the exposure variable are removed (e.g., see randomized experiments).
- Pearl extends probability calculus by introducing a new operator for describing interventions, the **do-operator**.

Example:

$P(\text{lung cancer}|\text{smoke})$

Probability somebody gets lung cancer,
given that he smokes.

$P(\text{lung cancer}|\text{do}(\text{smoke}))$

Probability somebody gets lung cancer,
if we force the person to smoke.

5. The Calculus of Causality

Application of the do-operator

Resolution of the Simpson's paradox

- Simpson's paradox is only paradoxical if we misinterpret
 $P(\text{recovery}|\text{lemons})$ as $P(\text{recovery}|\text{do}(\text{lemons}))$
- We should treat scurvy with lemons if
 $P(\text{recovery}|\text{do}(\text{lemons})) > P(\text{recovery}|\text{do}(\text{no lemons}))$

Derivation of the do-operator

- If identifiable,
 $P(\cdot|\text{do}(\cdot))$ can be calculated from G and observational Data
- In our example, we have

$$P(\text{recovery}|\text{do}(\text{lemons})) = \sum_{\text{age}} P(\text{age}) P(\text{recovery}|\text{age}, \text{lemons}) = 0.5$$

$$P(\text{recovery}|\text{do}(\text{no lemons})) = \sum_{\text{age}} P(\text{age}) P(\text{recovery}|\text{age}, \text{no lemons}) = 0.4$$

Causal Inference
Theory and Applications
in Enterprise Computing

Hagedorn, Huegle,
Perscheid

Slide 31

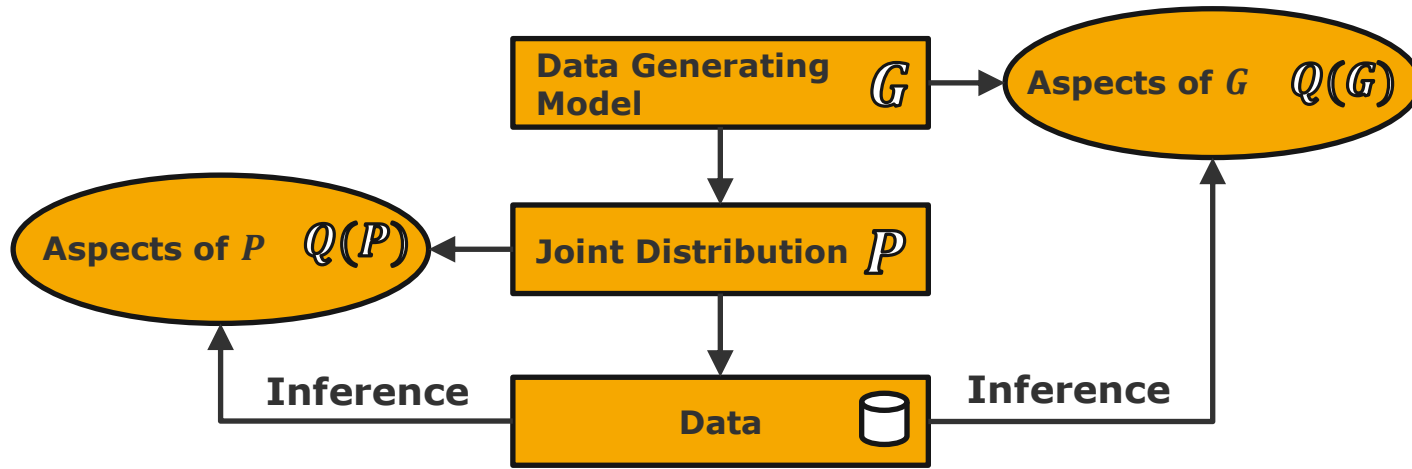

➔ We should treat scurvy with lemons!

6. Summary and Outlook

Concept

Traditional Statistical Inference Paradigm

Paradigm of Structural Causal Models

E.g., what is the sailors' probability of recovery when **we see** a treatment with lemons?

$$Q(P) = P(\text{recovery}|\text{lemons})$$

E.g., what is the sailors' probability of recovery if **we do** treat them with lemons?

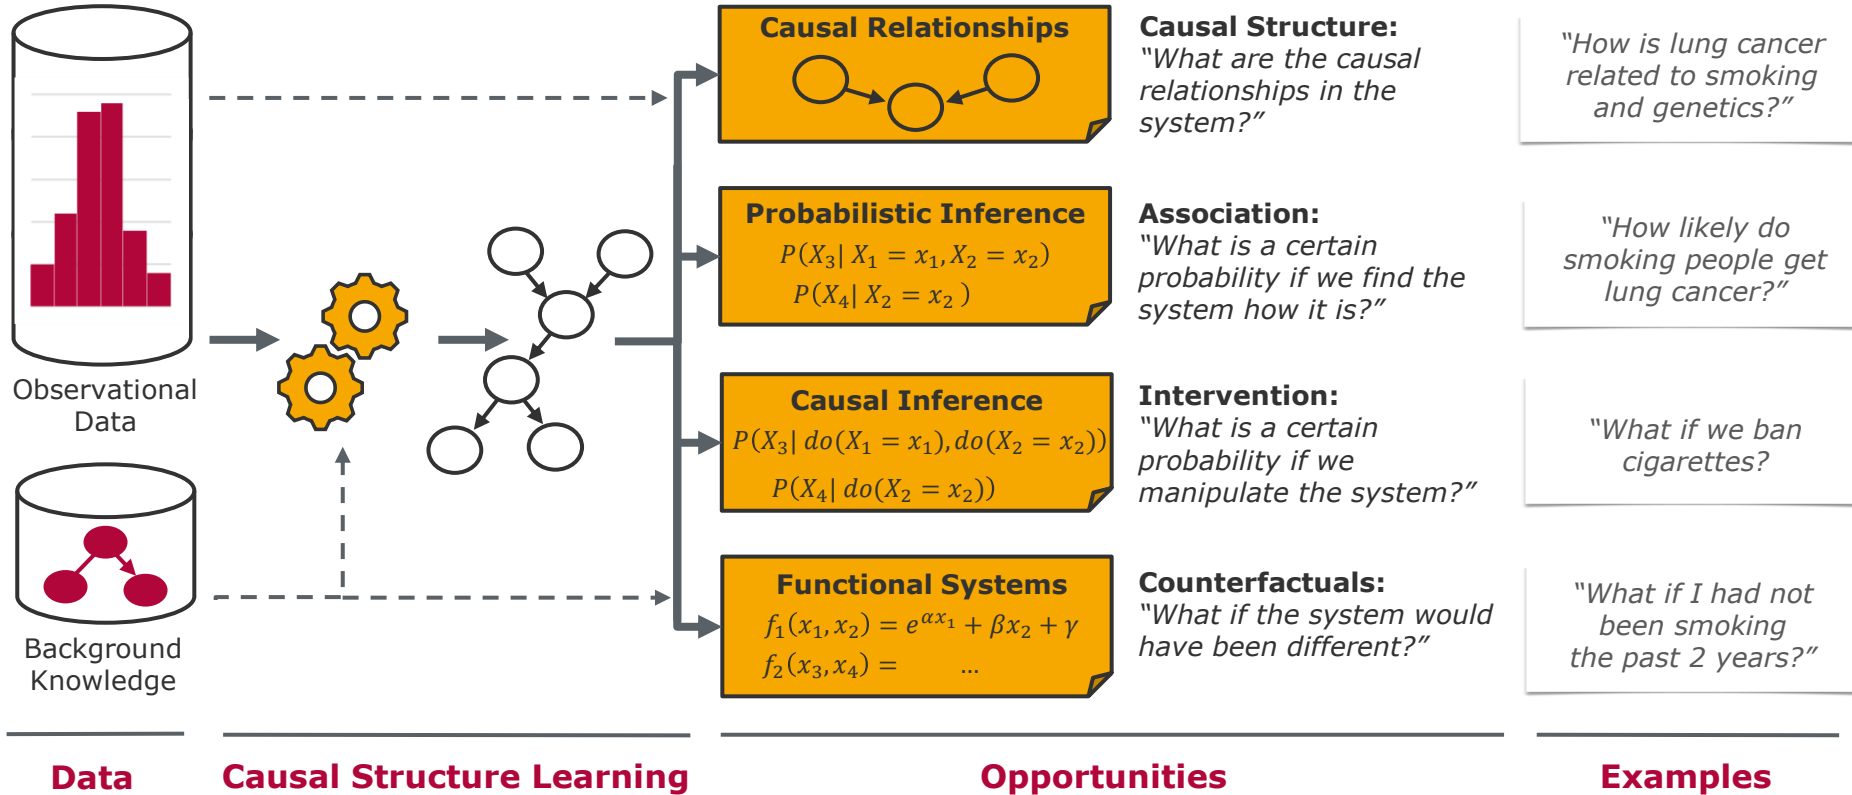

$$Q(G) = P(\text{recovery}|\text{do}(\text{lemons}))$$
